Intro

In this part of the project we will discuss what key features to include in our scientific poster. Let us break it down to a few crucial parts which need to exist in the poster.

- Title: the title needs to be as short as possible with as much important information to draw the reader's attention. It is helpful to write the title in an interrogatory form for example: Is the car-to-car communication the solution to traffic congestion?
- Abstract: This part is mostly included in scientific articles and researches which consists of a long text. If we would have to include an abstract in the poster, it has to be very short as possible. Because the poster text is already a type of abstract.
- Introduction: here it is recommended to write out the problem in a few paragraphs. The introduction needs to have a smooth text without any jargons unless necessary. It is helpful to include graphics in this section if it conveys the problem easily.
- Material and methods: In this part we would want to express the way of solving the problem. It is necessary to say why we chose a specific method.
- Results: In this section we only want to give a summary of the data results. It is not a conclusion at all. It is advisable to link the data with the research question. We might use images, charts, graphics but our decision has to be well thought out. Sometimes less is more.
- Conclusions: In this section we review the results and the research questions. It is necessary to give out why these results are significant for our research.
- References: This section is not intended for the readers to elapse readers time. Because this section is not quite understandable and readable. If this list is exhausting, we might need to shrink the text size as to save some space on the poster.
- Acknowledgements: In this section we include the names of the people who have contributed to this project. It can be researchers, fund providers etc. This section needs to be maximum one paragraph.
